

Thank you for purchasing an RC4Magic DMXmrX Miniature Receiver.

The **DMXmrX** is based on a **DMX2dim** dimmer, but with the dimmers hardware omitted. DMX data is provided through a miniplug-to-XLR adaptor, and DC power must be connected to power input screw terminals.

Enclosed is the DMX2dim Quick Start Guide. For the most part, information on the first nine pages directly apply to the DMXmrX, other than references to dimmer Set buttons.

Page 12 provides a power wiring diagram, of which only the left side, for power, is applicable to the DMXmrX. The DMXmrX (and all RC4 Series 3 products) provide a complete DMX universe of data out: whatever is going into the transmitter is what is coming out of the receiver. There are no dimmer or curve settings to be made, and all references to these things on pages 10 through 16 can be ignored.

If you have any questions or need assistance, do not hesitate to contact us.

Thank you!

Jim
